

CASSI: a genuinely non-uniform singular spectrum makes the modal-contraction theorem visible (MRI's is a single point)

(b) CASSI spectrum spans $528\times$
 $\sigma \in [0.01, 4.91]$ (79k modes)

(c) per-mode contraction spans
 $2e+04\times$ ($\lambda = 0.001$)

(a) σ across the detector: structured, not flat
